MTHSC 206 Section 14.6 – Directional Derivatives and the Gradient Vector

Kevin James

Definition

We define the directional derivative of the function $f(x, y)$ at the point (x_0, y_0) in the direction of the unit vector $u = (a, b)$ (u should be thought of as a vector in the xy-plane) as

$$D_u f(x_0, y_0) = \lim_{h \to 0} \frac{f(x_0 + ah, y_0 + bh) - f(x_0, y_0)}{h}.$$

Definition

We define the directional derivative of the function $f(x, y)$ at the point (x_0, y_0) in the direction of the unit vector $u = (a, b)$ (u should be thought of as a vector in the xy-plane) as

$$D_u f(x_0, y_0) = \lim_{h \to 0} \frac{f(x_0 + ah, y_0 + bh) - f(x_0, y_0)}{h}.$$

Theorem

If $f(x, y)$ is differentiable, then

$$D_u f(x, y) = f_x(x, y)a + f_y(x, y)b.$$

Proof.

Define $g(h) = f(x_0 + ah, y_0 + bh)$.

Proof.

Define $g(h) = f(x_0 + ah, y_0 + bh)$.
Then, we have that

$$g'(0) = \lim_{h \to 0} \frac{g(h) - g(0)}{h} =$$

PROOF.

Define $g(h) = f(x_0 + ah, y_0 + bh)$.
Then, we have that

$$g'(0) = \lim_{h\to 0} \frac{g(h) - g(0)}{h} = \lim_{h\to 0} \frac{f(x_0 + ah, y_0 + bh) - f(x_0, y_0)}{h}$$

PROOF.

Define $g(h) = f(x_0 + ah, y_0 + bh)$.
Then, we have that

$$\begin{aligned} g'(0) &= \lim_{h\to 0} \frac{g(h) - g(0)}{h} = \lim_{h\to 0} \frac{f(x_0 + ah, y_0 + bh) - f(x_0, y_0)}{h} \\ &= D_u f(x_0, y_0). \end{aligned}$$

Proof.

Define $g(h) = f(x_0 + ah, y_0 + bh)$.
Then, we have that

$$\begin{aligned} g'(0) &= \lim_{h\to 0} \frac{g(h) - g(0)}{h} = \lim_{h\to 0} \frac{f(x_0 + ah, y_0 + bh) - f(x_0, y_0)}{h} \\ &= D_u f(x_0, y_0). \end{aligned}$$

We can also write $g(h) = f(x, y)$ where $x = x_0 + ah$ and $y = y_0 + bh$.

PROOF.

Define $g(h) = f(x_0 + ah, y_0 + bh)$.
Then, we have that

$$\begin{aligned} g'(0) &= \lim_{h \to 0} \frac{g(h) - g(0)}{h} = \lim_{h \to 0} \frac{f(x_0 + ah, y_0 + bh) - f(x_0, y_0)}{h} \\ &= D_u f(x_0, y_0). \end{aligned}$$

We can also write $g(h) = f(x, y)$ where $x = x_0 + ah$ and $y = y_0 + bh$.
Applying the chain rule, we have,

$$g'(h) = f_x(x, y)a + f_y(x, y)b.$$

PROOF.

Define $g(h) = f(x_0 + ah, y_0 + bh)$.
Then, we have that

$$\begin{aligned} g'(0) &= \lim_{h\to 0} \frac{g(h) - g(0)}{h} = \lim_{h\to 0} \frac{f(x_0 + ah, y_0 + bh) - f(x_0, y_0)}{h} \\ &= D_u f(x_0, y_0). \end{aligned}$$

We can also write $g(h) = f(x, y)$ where $x = x_0 + ah$ and $y = y_0 + bh$.
Applying the chain rule, we have,

$$g'(h) = f_x(x, y)a + f_y(x, y)b.$$

Thus,

$$D_u f(x_0, y_0) = g'(0) = f_x(x_0, y_0)a + f_y(x_0, y_0)b.$$

□

Note

If the vector u is at an angle θ with the x-axis then we can write $u = (\cos(\theta), \sin(\theta))$. Thus

$$D_u f(x, y) = f_x(x, y)\cos(\theta) + f_y(x, y)\sin(\theta).$$

Note

If the vector u is at an angle θ with the x-axis then we can write $u = (\cos(\theta), \sin(\theta))$. Thus

$$D_u f(x, y) = f_x(x, y)\cos(\theta) + f_y(x, y)\sin(\theta).$$

Example

Find the directional derivative $D_u f(x, y)$ of the function $f(x, y) = x^2 + xy + y^2$ in the direction of the unit vector which is at an angle of $\theta = \frac{\pi}{3}$ to the x-axis.

Note

The directional derivative of f in the direction of u can be written as

$$D_u f(x,y) = (f_x(x,y), f_y(x,y)) \cdot u.$$

Note

The directional derivative of f in the direction of u can be written as

$$D_u f(x, y) = (f_x(x, y), f_y(x, y)) \cdot u.$$

Definition

We define the gradient of a function $f(x, y)$ as

$$\nabla f = (f_x(x, y), f_y(x, y)) = f_x(x, y)i + f_y(x, y)j.$$

Note

The directional derivative of f in the direction of u can be written as
$$D_u f(x,y) = (f_x(x,y), f_y(x,y)) \cdot u.$$

Definition

We define the gradient of a function $f(x,y)$ as
$$\nabla f = (f_x(x,y), f_y(x,y)) = f_x(x,y)i + f_y(x,y)j.$$

Fact

If u is a unit vector and $f(x,y)$ is a function of 2 variables then
$$D_u f(x,y) = \nabla f \cdot u.$$

Example

Consider the function $f(x, y) = e^{xy}$. Compute the gradient of f. Compute the directional derivative of f in the direction of $u = (\sqrt{3}/2, 1/2)$.

Definition

The <u>directional derivative</u> of $f(x,y,z)$ at (x_0,y_0,z_0) in the direction of the unit vector $u=(a,b,c)$ is

$$D_u f(x_0,y_0,z_0)=\lim_{h\to 0}\frac{f(x_0+ah,y_0+bh,z_0+ch)-f(x_0,y_0,z_0)}{h}.$$

if this limit exists.

Definition

The <u>directional derivative</u> of $f(x,y,z)$ at (x_0,y_0,z_0) in the direction of the unit vector $u=(a,b,c)$ is

$$D_u f(x_0,y_0,z_0)=\lim_{h\to 0}\frac{f(x_0+ah,y_0+bh,z_0+ch)-f(x_0,y_0,z_0)}{h}.$$

if this limit exists.

Fact

If $f(x,y,z)$ is differentiable then

$$D_u f(x,y,z)=f_x(x,y,z)a+f_y(x,y,z)b+f_z(x,y,z)c.$$

Definition

We define the gradient of $f(x, y, z)$ as

$$\nabla f = (f_x, f_y, f_z).$$

Definition

We define the gradient of $f(x, y, z)$ as

$$\nabla f = (f_x, f_y, f_z).$$

Fact

$$D_u f(x, y, z) = \nabla f(x, y, z) \cdot u$$

Definition

We define the gradient of $f(x, y, z)$ as

$$\nabla f = (f_x, f_y, f_z).$$

Fact

$$D_u f(x, y, z) = \nabla f(x, y, z) \cdot u$$

Example

Suppose that $f(x, y, z) = sin(xy)e^z$. Compute ∇f. What is the directional derivative at $(\pi, 1/2, 0)$ in the direction $(\sqrt{3}/3, \sqrt{3}/3, \sqrt{3}/3)$. Can you find the direction which maximizes $D_u f$ at this point?

Theorem

Suppose that f is a differentiable function of two or three variables. The maximal value of the directional derivative $D_u f(\vec{x})$ at the point $\vec{x}$ is $|\nabla f|$ and it occurs when $u = \frac{1}{|\nabla f|}\nabla f$.

Theorem

Suppose that f is a differentiable function of two or three variables. The maximal value of the directional derivative $D_u f(\vec{x})$ at the point $\vec{x}$ is $|\nabla f|$ and it occurs when $u = \frac{1}{|\nabla f|}\nabla f$.

Example

Consider the function $f(x, y, z) = e^{xyz}$. What is the directional derivative at the point $(0, 1, 0)$ in the direction of $\overrightarrow{((0, 1, 0), (1, 1, 1))}$. What is the maximum value of the directional derivative at this point? In which direction does it occur?

Theorem

Supposing all functions to be differentiable, we can use the chain rule to obtian,

$$0 = F_x x'(t) + F_y y'(t) + F_z z'(t) = \nabla F \cdot r'(t).$$

Tangent Planes to Level Surfaces

Suppose that S is the level surface of $F(x, y, z)$ given by $F(x, y, z) = k$ and $P = (x_0, y_0, z_0)$ is a point on S.
Let C be any curve that lies on S and passes through P.
Then C can be parametrized by $r(t) = (x(t), y(t), z(t))$.
Suppose that $r(t_0) = P$.
Note that $F(x(t), y(t), z(t)) = k$ because C lies on S.
Supposing all functions to be differentiable, we can use the chain rule to obtian,

$$0 = F_x x'(t) + F_y y'(t) + F_z z'(t) = \nabla F \cdot r'(t).$$

That is, $\nabla F(P)$ is orthogonal to the tangent vector at P of any curve along S passing through P.

Definition

We define the tangent plane to the level surface $F(x, y, z) = k$ at $P = (x_0, y_0, z_0)$ as the plane that passes through P and has normal vector $\nabla F(x_0, y_0, z_0)$. This plane has equation

$$F_x(x_0, y_0, z_0)(x-x_0)+F_y(x_0, y_0, z_0)(y-y_0)+F_z(x_0, y_0, z_0)(z-z_0) = 0.$$

or

$$\nabla F(x_0, y_0, z_0) \cdot \overrightarrow{(P, (x, y, z))} = 0$$

Definition

We define the normal line to the level surface $F(x, y, z) = k$ at P to be the line passing through P and orthogonal to the tangent plane,

Definition

We define the normal line to the level surface $F(x, y, z) = k$ at P to be the line passing through P and orthogonal to the tangent plane, that is the line through P parallel to the normal vector for the tangent plane which is $\nabla F(P)$.

Definition

We define the normal line to the level surface $F(x, y, z) = k$ at P to be the line passing through P and orthogonal to the tangent plane, that is the line through P parallel to the normal vector for the tangent plane which is $\nabla F(P)$. This line has symmetric equations

$$\frac{x - x_0}{F_x(x_0, y_0, z_0)} = \frac{y - y_0}{F_y(x_0, y_0, z_0)} = \frac{z - z_0}{F_z(x_0, y_0, z_0)}.$$

Note

We can think of the graph $z = f(x, y)$ of $f(x, y)$ as the level surface $F(x, y, z) = 0$ where $F(x, y, z) = f(x, y) - z$.

Note

We can think of the graph $z = f(x,y)$ of $f(x,y)$ as the level surface $F(x,y,z) = 0$ where $F(x,y,z) = f(x,y) - z$.
In this case, $\nabla F = (f_x, f_y, -1)$

Note

We can think of the graph $z = f(x, y)$ of $f(x, y)$ as the level surface $F(x, y, z) = 0$ where $F(x, y, z) = f(x, y) - z$.
In this case, $\nabla F = (f_x, f_y, -1)$
So the tangent plane to the graph of f as a level surface at P would have equation

$$f_x(x_0, y_0, z_0)(x - x_0) + f_y(x_0, y_0, z_0)(y - y_0) - (z - z_0) = 0.$$

which is consistent with our previous definition of tangent plane.

Note

We can think of the graph $z = f(x, y)$ of $f(x, y)$ as the level surface $F(x, y, z) = 0$ where $F(x, y, z) = f(x, y) - z$.
In this case, $\nabla F = (f_x, f_y, -1)$
So the tangent plane to the graph of f as a level surface at P would have equation

$$f_x(x_0, y_0, z_0)(x - x_0) + f_y(x_0, y_0, z_0)(y - y_0) - (z - z_0) = 0.$$

which is consistent with our previous definition of tangent plane.
The normal line has equation

$$\frac{x - x_0}{f_x(x_0, y_0, z_0)} = \frac{y - y_0}{f_y(x_0, y_0, z_0)} = -(z - z_0).$$

Example

Find the equations of the tangent plane and normal line at the point $(3, 2, 2)$ to the ellipsoid $\frac{x^2}{9} + \frac{y^2}{4} + z^2 = 6$.
