

# MTHSC 206 SECTION 15.10 – CHANGE OF VARIABLES IN MULTIPLE INTEGRALS

Kevin James

## RECALL

In one variable calculus we recall the change of variable formula for integration is

$$\int_a^b f(x) dx = \int_{g^{-1}(a)}^{g^{-1}(b)} f(g(u))g'(u) du$$

where we have substituted  $x = g(u)$ . We are assuming that  $g$  is one to one on  $[a, b]$  and that  $g$  is continuous.

## HEURISTIC EXPLANATION

Suppose that we take  $\Delta u = \frac{g^{-1}(b) - g^{-1}(a)}{n}$ ,  $u_i = g^{-1}(a) + i\Delta u$ .

Then take  $x_i = g(u_i)$  so that  $\Delta x = g(u_i) - g(u_{i-1})$ .

Note that  $\Delta x = g(u_{i-1} + \Delta u) - g(u_{i-1}) \approx g'(u_{i-1})\Delta u$ .

$$\begin{aligned}\int_a^b f(x) \, dx &\approx \sum_{i=1}^n f(x_{i-1})\Delta x \\ &\approx \sum_{i=1}^n f(g(u_{i-1}))(g'(u_{i-1})\Delta u) \\ &\approx \int_{g^{-1}(a)}^{g^{-1}(b)} f(g(u))g'(u) \, du.\end{aligned}$$

## NOTE

In the one variable change of variables formula, we replace  $dx$  with  $g'(u) du$  because when  $x = g(u)$  and  $g$  is differentiable,  $\Delta x \approx g'(u)\Delta u$ . That is, our measure of length changes when we replace the interval  $[a, b]$  with the interval  $[g(a), g(b)]$ .

## TWO VARIABLE INTEGRATION

Suppose now that we wish to integrate  $f(x, y)$  over  $R$ .

Suppose that we have a differentiable 1-1 function

$T(u, v) = [g(u, v), h(u, v)]$  with  $T(S) = R$ .

We would like to replace  $\iint_R f(x, y) \, dA$  with an integral over the region  $S$ .

Now, we can proceed as before. Subdivide  $S$  into rectangles

$S_{ij} = [u_{i-1}, u_i] \times [v_{i-1}, v_i]$  with dimensions  $\Delta u$  and  $\Delta v$  as usual.

Subdivide  $R$  into subregions  $R_{ij} = T(S_{ij})$ .

## TWO VARIABLE INTEGRATION CONTINUED

Then,

$$\begin{aligned} \iint_R f(x, y) \, dA &\approx \sum_{i,j} f(x_{i-1}, y_{j-1}) \text{Area}(R_{ij}) \\ &\approx \sum_{i,j} f(g(u_{i-1}, v_{j-1}), h(u_{i-1}, v_{j-1})) \text{Area}(T(S_{ij})) \\ &\approx \sum_{i,j} f(g(u_{i-1}, v_{j-1}), h(u_{i-1}, v_{j-1})) \left| \overrightarrow{\Delta T_{u,i-1,j-1}} \times \overrightarrow{\Delta T_{v,i-1,j-1}} \right|, \end{aligned}$$

where

$$\overrightarrow{\Delta T_{u,i-1,j-1}} = T(u_{i-1} + \Delta u, v_{j-1}) - T(u_{i-1}, v_{j-1}) \approx \Delta u \overrightarrow{T_u(u_{i-1}, v_{j-1})}$$

and

$$\overrightarrow{\Delta T_{v,i-1,j-1}} = T(u_{i-1}, v_{j-1} + \Delta v) - T(u_{i-1}, v_{j-1}) \approx \Delta v \overrightarrow{T_v(u_{i-1}, v_{j-1})}.$$

Thus,  $\iint_R f(x, y) \, dA$  is approximated by

$$\sum_{i,j} f(g(u_{i-1}, v_{j-1}), h(u_{i-1}, v_{j-1})) \left| \overrightarrow{T_u(u_{i-1}, v_{j-1})} \times \overrightarrow{T_v(u_{i-1}, v_{j-1})} \right| \Delta u \Delta v.$$

## NOTE

Since  $T = [g, h]$ , we have

$$\begin{aligned} |\vec{T}_u \times \vec{T}_v| &= \left| \det \begin{pmatrix} i & j & k \\ g_u & h_u & 0 \\ g_v & h_v & 0 \end{pmatrix} \right| = \left| \det \begin{pmatrix} g_u & h_u \\ g_v & h_v \end{pmatrix} k \right| = \\ & \left| \det \begin{pmatrix} g_u & g_v \\ h_u & h_v \end{pmatrix} \right|. \end{aligned}$$

## DEFINITION

We define the Jacobian of the transformation  $T$  given by  $x = g(u, v)$  and  $y = h(u, v)$  by

$$\frac{\partial(x, y)}{\partial(u, v)} = \det \begin{pmatrix} \frac{\partial x}{\partial u} & \frac{\partial x}{\partial v} \\ \frac{\partial y}{\partial u} & \frac{\partial y}{\partial v} \end{pmatrix}$$

## THEOREM

Suppose that  $T$  is a  $C^1$  transformation whose Jacobian is nonzero and that maps a region  $S$  in the  $uv$ -plane onto a region  $R$  in the  $xy$ -plane. Suppose that  $f$  is continuous on  $R$  and that  $R$  and  $S$  are type 1 or type 2 plane regions. Suppose that  $T$  is one-to-one except perhaps on the boundary of  $S$ . Then

$$\int \int_R f(x, y) \, dA = \int \int_S f(x(u, v), y(u, v)) \left| \frac{\partial(x, y)}{\partial(u, v)} \right| \, du \, dv.$$
