POLYNOMIAL RINGS, MATRIX RINGS AND GROUP RINGS

Kevin James

POLYNOMIAL RINGS

Definition

Suppose that R is a ring. We define the ring of polynomials in the variable x as

$$R[x] = \{\sum_{n=0}^d a_n x^n \mid a_n \in R\}.$$

Addition and multiplication are defined as follows

•
$$\sum_{n=0}^{d_1} a_n x^n + \sum_{n=0}^{d_2} b_n x^n = \sum_{n=0}^{\max(d_1, d_2)} (a_n + b_n) x^n.$$

$$\left(\sum_{n=0}^{d_1} a_n x^n \right) \times \left(\sum_{n=0}^{d_2} b_n x^n \right) = \sum_{n=0}^{d_1} \sum_{m=0}^{d_2} a_n b_m x^{n+m}$$
$$= \sum_{n=0}^{d_1+d_2} \left(\sum_{j=0}^n a_j b_{n-j} \right) x^n$$

Note

- **1** $R \hookrightarrow R[x]$. This copy of R in R[x] is called the constant polynomials.
- 2 R[x] is a ring with $0_{R[x]} = 0_R$.
- **3** If R is commutative then so is R[x].
- **4** if R has an identity 1_R then R[x] has an identity $1_{R[x]} = 1_R$.

6 If $f(x) = \sum_{n=0}^{d}$ and $a_d \neq 0_R$, then *d* is said to be the <u>degree</u> of f(x) and a_d is said to be the leading coefficient. We will leave the degree of the 0 polynomial undefined but take the leading coefficient to be 0_R .

PROPOSITION

Let R be an integral domain and let $p(x), q(x) \in R[x]$ be nonzero. Then,

- $(\log(pq) = \deg(p) + \deg(q).$
- 2 the units of R[x] are jus the units of R.
- **3** R[x] is an integral domain.

Definition

Suppose that R is a ring and that $0 \le n \in \mathbb{Z}$. Then we define $M_n(R)$ to be the set of $n \times n$ matrices with coefficients in R. We define addition component wise as usual and define multiplication as for $M_n(\mathbb{R})$.

Note

- **1** If R is nontrivial, then $M_n(R)$ is non-commutative.
- 2 If R is nontrivial, then $M_n(R)$ has zero divisors.
- **3** Note that $R \hookrightarrow M_n(R)$ as scalar matrices.
- **4** The scalar matrices commute if and only if R is commutative.
- **6** If R has an identity, then the matrix with 1_R in each diagonal entry and 0_R elsewhere is an identity for $M_n(R)$.
- **6** In the case that R has an identity, we define $\mathbb{G}L_n(R) = M_n(R)^*$

Definition

Suppose that *R* is a commutative ring with identity and that $G = \{g_1, \ldots, g_n\}$ is any finite group with group operation written multiplicatively. Define the group ring *RG* of *G* with coefficients in *R* as follows

$$\mathsf{RG} = \left\{ \sum_{j=1}^n \mathsf{a}_j \mathsf{g}_j \mid \mathsf{a}_j \in \mathsf{R}; \mathsf{g}_j \in \mathsf{G}
ight\},$$

where the sums are formal sums.

Addition is defined componentwise:

$$\begin{split} \sum_{j=1}^{n} a_j g_j + \sum_{j=1}^{n} b_j g_j &= \sum_{j=1}^{n} (a_j + b_j) g_j. \\ \text{Multiplication: We define } (ag_i)(bg_j) &= (ab)(g_i g_j) \text{ where the first} \\ \text{product is in } R \text{ and the second is in } G. \\ \text{We extend the multiplication to } RG \text{ as} \\ \left(\sum_{j=1}^{n} a_j g_j\right) &* \left(\sum_{j=1}^{n} b_j g_j\right) &= \sum_{j=1}^{n} \left(\sum_{g_m g_n = g_j} a_m b_n\right) g_j \end{split}$$

Note

- 1 If *R* and *G* are as above then *RG* is a ring.
- **2** It is not necessary for R to be commutative.
- $\mathbf{8}$ RG is commutative if and only if R and G are.
- **4** $R \hookrightarrow RG.$
- **5** The elements of *R* commute with the elements of *RG* assuming commutativity of *R*.

6
$$1_{RG} = 1_R 1_G$$
.
