MthSc 208, Fall 2010 (Differential Equations) Dr. Matthew Macauley HW 21 Due Friday December 3rd, 2010

- (1) Which of the following functions are harmonic?
 - (a) f(x) = 10 3x.
 - (b) $f(x,y) = x^2 + y^2$.
 - (c) $f(x,y) = x^2 y^2$.
 - (d) $f(x,y) = e^x \cos y$.
 - (e) $f(x,y) = x^3 3xy^2$.
- (2) (a) Solve the following Dirichlet problem for Laplace's equation in a square region: Find u(x, y), 0 ≤ x ≤ π, 0 ≤ y ≤ π such that

$$\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = 0, \qquad u(0, y) = u(\pi, y) = 0,$$
$$u(x, 0) = 0, \quad u(x, \pi) = 4\sin x - 3\sin 2x + 2\sin 3x.$$

(b) Solve the following Dirichlet problem for Laplace's equation in the same square region: Find $u(x, y), 0 \le x \le \pi, 0 \le y \le \pi$ such that

$$\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = 0, \qquad u(0, y) = 0, \quad u(\pi, y) = y(\pi - y),$$
$$u(x, 0) = u(x, \pi) = 0$$

(c) By adding the solutions to parts (a) and (b) together (superposition), find the solution to the Dirichlet problem: Find u(x, y), $0 \le x \le \pi$, $0 \le y \le \pi$ such that

$$\begin{aligned} \frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} &= 0, \qquad u(0,y) = 0, \quad u(\pi,y) = y(\pi - y), \\ u(x,0) &= 0, \quad u(x,\pi) = 4\sin x - 3\sin 2x + 2\sin 3x. \end{aligned}$$

- (d) Sketch the solutions to (a), (b), and (c). *Hint: it is enough to sketch the boundaries, and then use the fact that the solutions are harmonic functions.*
- (e) Consider the heat equation in a square region, along with the following boundary conditions:

$$\begin{aligned} \frac{\partial u}{\partial t} &= \frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2}, \qquad u(0,y) = 0, \quad u(\pi,y) = y(\pi - y), \\ u(x,0) &= 0, \quad u(x,\pi) = 4\sin x - 3\sin 2x + 2\sin 3x. \end{aligned}$$

What is the steady-state solution? (Note: This will *not* depend on the initial conditions!)

(3) Consider the following initial/boundary value problem for the heat equation in a square region, and the function u(x, y, t), where $0 \le x \le \pi$, $0 \le y \le \pi$ and $t \ge 0$.

$$\begin{aligned} \frac{\partial u}{\partial t} &= \frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} \\ u(x,0,t) &= u(x,\pi,t) = u(0,y,t) = u(\pi,y,t) = 0 \\ u(x,y,0) &= 2\sin x \sin y + 5\sin 2x \sin y. \end{aligned}$$

- (a) Briefly describe, and sketch, a physical situation which this models. Be sure to explain the effect of the boundary conditions and the initial condition.
- (b) Assume that the solution has the form u(x, y, t) = f(x, y)g(t). Find u_{xx}, u_{yy} , and u_t .

- (c) Plug u = fg back into the PDE and divide both sides by fg (i.e., "separate variables") to get the *eigenvalue problem*. Briefly justify why this quantity must be a constant. Call this constant λ . Write down an ODE for g(t), and a PDE for f(x, y) (the *Helmholz equation*). Include four boundary conditions for f(x, y).
- (d) Solve the Helmholz equation and determine λ . You may assume that f(x, y) = X(x)Y(y).
- (e) Solve the ODE for g(t).
- (f) Find the general solution of the boundary value problem. It will be a superposition (infinite sum) of solutions $u_{nm}(x, y, t) = f_{nm}(x, y)g_{nm}(t)$.
- (g) Find the particular solution to the initial value problem that additionally satisfies the initial condition $u(x, y, 0) = 2 \sin x \sin y + 5 \sin 2x \sin y$.
- (h) What is the steady-state solution? Give a mathematical *and* intuitive (physical) justification.
- (4) Consider the following initial/boundary value problem for the heat equation in a square region, and the function u(x, y, t), where $0 \le x \le \pi$, $0 \le y \le \pi$ and $t \ge 0$.

$$\begin{split} &\frac{\partial u}{\partial t} = \frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} \\ &u(x,0,t) = u(x,\pi,t) = u(0,y,t) = u(\pi,y,t) = 0 \\ &u(x,y,0) = (7\sin x) \, y(\pi-y). \end{split}$$

Since the only difference between this problem and the previous one is in the initial condition, steps (b)–(f) are the same and need not be repeated. Briefly describe, and sketch, a physical situation which this models, and then carry out steps (g) and (h), given this new initial condition.

(5) Consider the 2D heat equation

$$\frac{\partial u}{\partial t} = \frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2}$$

subject to the boundary conditions

$$u(x, 0, t) = u(0, y, t) = u(\pi, y, t) = 0$$
$$u(x, \pi, t) = x(\pi - x).$$

- (a) What is the steady-state solution, $u_{ss}(x, y)$? [Hint: Look at a previous problem on Laplace's equation]. Sketch it.
- (b) Write down the general solution this this boundary value problem by adding $u_{ss}(x, y)$ to the general solution of a related *homogeneous* boundary value problem [Hint: Look at a previous problems on the 2D heat equation].
- (6) Solve the following initial value problem for a vibrating square membrane: Find u(x, y, t), $0 \le x \le \pi$, $0 \le y \le \pi$ such that

$$\begin{split} &\frac{\partial^2 u}{\partial t^2} = \frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2},\\ &u(x,0,t) = u(x,\pi,t) = u(0,y,t) = u(\pi,y,t) = 0\\ &u(x,y,0) = p(x)q(y), \qquad u_t(x,y,0) = 0. \end{split}$$

where

$$p(x) = \begin{cases} x, & \text{for } 0 \le x \le \pi/2, \\ \pi - x, & \text{for } \pi/2 \le x \le \pi, \end{cases}, \qquad p(y) = \begin{cases} y, & \text{for } 0 \le y \le \pi/2, \\ \pi - y, & \text{for } \pi/2 \le y \le \pi. \end{cases}$$

(a) Briefly describe a physical situation which this models. Be sure to explain the effect of the boundary conditions and the initial condition. Sketch the initial displacement, u(x, y, 0).

- (b) Assume that the solution has the form u(x, y, t) = f(x, y)g(t). Find u_{xx} , u_{yy} , u_t , and u_{tt} .
- (c) Plug u = fg back into the PDE and divide both sides by fg (i.e., "separate variables") to get the *eigenvalue problem*. Briefly justify why this quantity must be a constant. Call this constant λ . Write down an ODE for g(t), and a PDE for f(x, y) (the *Helmholz equation*). Include four boundary conditions for f(x, y) and one for g(t).
- (d) You may assume that $\lambda = -(n^2 + m^2)$, and that the solution to the Helmholz equation is $f(x, y) = b_{nm} \sin nx \sin my$. Solve the ODE for g(t), using the initial condition.
- (e) Find the general solution of the boundary value problem. It will be a superposition (infinite sum) of solutions $u_{nm}(x, y, t) = f_{nm}(x, y)g_{nm}(t)$.
- (f) Find the particular solution to the initial value problem that additionally satisfies the initial condition u(x, y, 0) = p(x)q(y).
- (g) What is the long-term behavior of u(x, y, t), i.e., as $t \to \infty$. Give a mathematical and intuitive (physical) justification.
