

## MthSc 208: Differential Equations (Summer II, 2012)

### In-class Worksheet 7c: The 2D Heat Equation

**NAME:**

We will solve for the function  $u(x, y, t)$  defined for  $0 \leq x, y \leq \pi$  and  $t \geq 0$  which satisfies the following initial value problem of the heat equation:

$$\begin{aligned}u_t &= c^2(u_{xx} + u_{yy}) & u(0, y, t) = u(\pi, y, t) = u(x, 0, t) = u(x, \pi, t) &= 0, \\u(x, y, 0) &= 2 \sin x \sin 2y + 3 \sin 4x \sin 5y.\end{aligned}$$

(a) Carefully describe (and sketch) a physical situation that this models.

(b) Assume that  $u(x, y, t) = f(x, y)g(t)$ . Compute  $u_{xx}$ ,  $u_{yy}$ , and  $u_t$ , find boundary conditions for  $f(x, y)$ .

- (c) Plug  $u = fg$  back into the PDE and separate variables by dividing both sides of the equation by  $c^2 fg$ . Set this equal to a constant  $\lambda$ , and write down two equations: an ODE for  $g(t)$ , and a PDE  $f(x, y)$  (called the *Helmholtz equation*), with four boundary conditions.
- (d) Solve the ODE for  $g(t)$ .
- (e) To solve the PDE for  $f$ , assume that  $f(x, y) = X(x)Y(y)$ . Plug this back in and separate variables. [For consistency, put the  $X''/X$  term on one side of the equation, and set equal to a constant  $\mu$ .]

- (f) Write down two ODEs – one for  $X(x)$  and one for  $Y(y)$ , and include boundary conditions for both.  
*Hint:* It is easier notationally if you introduce a new constant,  $\nu := \lambda - \mu$ .

- (g) Solve the ODEs for  $X(x)$  and  $Y(y)$ , and determine  $\mu$  and  $\nu$  (and hence  $\lambda$ ). You should get a  $\lambda$  for each choice of positive integers  $n, m \in \mathbb{N}$ , call it  $\lambda_{nm}$ .

- (h) For each  $n, m \in \mathbb{N}$ , we have a solution  $u_{nm}(x, y, t) = f_{nm}(x, y)g_{nm}(t)$ . Write down this solution.

- (i) Find the general solution of the PDE. It will be a doubly infinite sum (superposition) of solutions:

$$\sum_{n,m \in \mathbb{N}} u_{nm}(x, y, t).$$

- (g) Find the particular solution to the initial value problem by using the initial condition.

- (h) What is the long-term behavior of the system? Give a mathematical, and physical, justification.
