

TOPICS: REAL FOURIER SERIES, AND FOURIER SINE & COSINE SERIES

1. Find the Fourier series of the following functions *without* computing any integrals.

(a) $f(x) = 2 - 3 \sin 4x + 5 \cos 6x$,

(b) $f(x) = \sin^2 x$. [*Hint*: Use a standard trig identity.]

2. Consider the sawtooth wave defined on $[-1, 1]$ by the function $f(t) = t$, and extended to be periodic of period $T = 2$.

(a) Sketch the graph of $f(t)$ on $[-7, 7]$.

(b) Compute the Fourier series of $f(t)$.

(c) The differential equation

$$x''(t) + \omega^2 x(t) = f(t)$$

describes the motion of a simple harmonic oscillator, subject to a driving force given by the sawtooth wave $f(t)$. Find the general solution by first solving the homogeneous equation, and then looking for a particular solution of the form

$$x_p(t) = \sum_{n=1}^{\infty} b_n \sin(n\pi t).$$

3. Consider the 2π -periodic function defined on $[-\pi, \pi]$ by

$$f(t) = \begin{cases} 0 & -\pi \leq t < 0, \\ t & 0 \leq t \leq \pi, \end{cases}$$

(a) Sketch the graph of $f(t)$ on $[-7\pi, 7\pi]$.

(b) Compute the Fourier series of $f(t)$.

(c) Sketch the graph of the resulting Fourier series. [It will be the same as the answer to Part (a) *except* at the points of discontinuity.]

(d) Solve the differential equation $x''(t) + \omega^2 x(t) = f(t)$. Look for a particular solution of the form

$$x_p(t) = \frac{a_0}{2} + \sum_{n=1}^{\infty} a_n \cos nt + b_n \sin nt.$$

4. Determine which of the following functions are even, which are odd, and which are neither.

(a) $f(x) = x^3 + 3x$

(e) $f(x) = \frac{1}{x}$

(b) $f(x) = 4 \sin 2x$

(f) $f(x) = \frac{1}{2}(e^x + e^{-x})$

(c) $f(x) = x^2 + |x|$

(g) $f(x) = x \cos x$

(d) $f(x) = e^x$

(h) $f(x) = \frac{1}{2}(e^x - e^{-x})$.

5. In this problem, we will investigate why in many Fourier series, every other coefficient is zero. This has to do with certain symmetries in the graph.
- (a) The Fourier series of an odd function consists only of sine-terms. What additional symmetry conditions on f will imply that the sine coefficients with even indices will be zero (i.e., each $b_{2n} = 0$)? Give an example of a non-zero function satisfying this additional condition.
 - (b) What symmetry conditions on f will imply that the sine coefficients with odd indices will be zero (i.e., each $b_{2n+1} = 0$)? Give an example of a non-zero function satisfying this additional condition.
 - (c) Sketch the graph of a non-zero even function, such that $a_{2n} = 0$ for all n .
 - (d) Sketch the graph of a non-zero even function, such that $a_{2n+1} = 0$ for all n .
6. Consider the function $f(x) = x^2$ defined on the interval $[0, L]$. For this problem, you will determine the Fourier series, Fourier cosine series, and Fourier sine series of $f(x)$. Feel free to use a computer to find any indefinite integrals that you need.
- (a) Sketch the even extension of f and compute its Fourier cosine series.
 - (b) Sketch the odd extension of f and compute its Fourier sine series.
 - (c) Sketch the periodic extension of f and compute its Fourier series.
