

NAME:

(a) Sketch this mass-spring system, before and after the mass is place on the spring. (Let $x = 0$ be the height of the spring without the mass).

(b) At equilibrium, the spring force kx_0 equals the gravitational force, mg , in magnitude. Use this to solve for the spring constant k .

(c) Newton's 2nd law tells us that $F = mx''$, which is equal to the sum of the forces (gravitational and spring). Write down a second-order differential equation that models this. Include both initial conditions, $x(0)$ and $x'(0)$.

(d) Find the general solution to this ODE. Is there a steady-state solution? If so, describe it.

(e) Solve the initial value problem. (*Hint*: Use the “simplest” initial condition first).
