

Read: Lax, Chapter 5, pages 44–57.

1. Let S_n denote the set of all permutations of $\{1, \dots, n\}$.
 - (a) Prove that $\text{sgn}(\pi_1 \circ \pi_2) = \text{sgn}(\pi_1) \text{sgn}(\pi_2)$.
 - (b) Let $\pi \in S_n$, and suppose that $\pi = \tau_k \circ \dots \circ \tau_1 = \sigma_\ell \circ \dots \circ \sigma_1$, where $\tau_i, \sigma_j \in S_n$ are transpositions. Prove that $k \equiv \ell \pmod{2}$.
2. Let X be an n -dimensional vector space over a field K .
 - (a) Prove that if the characteristic of K is not 2, then every skew-symmetric form is alternating.
 - (b) Give an example of a non-alternating skew-symmetric form.
 - (c) Give an example of a non-zero alternating k -linear form ($k < n$) such that $f(x_1, \dots, x_k) = 0$ for some set of linearly independent vectors x_1, \dots, x_k .
3. Let X be a 2-dimensional vector space over \mathbb{C} , and let $f: X \times X \rightarrow \mathbb{C}$ be an alternating, bilinear form. If $\{x_1, x_2\}$ is a basis of X , determine a formula for $f(u, v)$ in terms of $f(x_1, x_2)$, and the coefficients used to express u and v with this basis. [Pun intended!]
4. Let X be an n -dimensional vector space over \mathbb{R} , and let f be a non-degenerate symmetric bilinear form. That is, it has the additional property that for all nonzero $x \in X$, there is some $y \in X$ for which $f(x, y) \neq 0$.
 - (a) Prove that the map $L: X \rightarrow X'$ given by $L: x \mapsto f(x, -)$ is an isomorphism.
 - (b) Show that, given any basis x_1, \dots, x_n for X , there exists a basis y_1, \dots, y_n such that $f(x_i, y_j) = \delta_{ij}$.
 - (c) Conversely, prove that if $B_X = \{x_1, \dots, x_n\}$ and $B_Y = \{y_1, \dots, y_n\}$ are sets of vectors in X with $f(x_i, y_j) = \delta_{ij}$, then B_X and B_Y are bases for X .
5. Let X be an n -dimensional vector space over \mathbb{R} , and let f be a non-degenerate symmetric bilinear form.
 - (a) Show that there exists $x_1 \in X$ with $f(x_1, x_1) \neq 0$.
 - (b) Any fixed $x_1 \in X$ for which $f(x_1, x_1) \neq 0$ induces a *linear* map $T = f(x_1, -)$. Show that the nullspace N_T has dimension $n - 1$.
 - (c) Let $Z_1 = N_T$. Show that the restriction of f to $Z_1 \times Z_1$ is again non-degenerate.
 - (d) Prove that X has a basis $\{x_1, \dots, x_n\}$ such that $f(x_i, x_i) \neq 0$ for all i , and $f(x_i, x_j) = 0$ whenever $i \neq j$.
 - (e) Give an example of a vector space X ($2 \leq \dim X < \infty$) with basis B and a non-degenerate symmetric bilinear form f for which $f(x, x) = 0$ for all $x \in B$.
6. Let $A = (c_1, \dots, c_n)$ be an $n \times n$ matrix (c_i is a column vector), and let B be the matrix obtained from A by adding k times the i^{th} column of A to the j^{th} column of A , for $i \neq j$. Prove that $\det A = \det B$.
