Read: Lax, Appendix 15, pages 363–366.

- 1. Let A be a 7 × 7 matrix over  $\mathbb{C}$  with minimal polynomial  $m(t) = (t-1)^3(t-2)^2$ .
  - (a) List all possible Jordan canonical forms of A of to similarity.
  - (b) For each matrix from Part (a), find the rank of  $(A I)^k$  and  $(A 2I)^k$ , for  $k \in \mathbb{N}$ .
- 2. Let A be an  $n \times n$  matrix over  $\mathbb{C}$ . The matrix A is *nilpotent* if  $A^k = 0$  for some  $k \in \mathbb{N}$ .
  - (a) Prove that if A is nilpotent, then  $A^n = 0$ .
  - (b) Prove that if A is nilpotent, then there is some  $r \in \mathbb{N}$  and positive integers  $k_1 \geq \cdots \geq k_r$  with  $k_1 + \cdots + k_r = n$  that determine A up to similarity.
  - (c) Suppose A and B are  $6 \times 6$  nilpotent matrices with the same minimal polynomial and dim  $N_A = \dim N_B$ . Prove that A and B are similar. Show by example that this can fail for  $7 \times 7$  matrices.
- 3. Let A and B be  $n \times n$  matrices over  $\mathbb{C}$ . The matrix A is *idempotent* if  $A^2 = A$ .
  - (a) Prove that if  $A^k = A$  for some integer k > 1, then A is diagonalizable.
  - (b) Prove that idempotent matrices are similar if and only if they have the same trace.
  - (c) Prove that if A and B are idempotent and B = UAV holds for some invertible maps  $U, V: X \to X$ , then A and B are similar.
- 4. Let X be an n-dimensional vector space over  $\mathbb{C}$ , and let  $A, B: X \to X$  be linear maps.
  - (a) Prove that if AB = BA, then for any eigenvector v of A with eigenvalue  $\lambda$ , the vector Bv is an eigenvector of A for  $\lambda$ .
  - (b) Show that if  $\{A_1, \ldots, A_k \mid A_i \colon X \to X\}$  is a set of pairwise commuting maps, then there is a nonzero  $x \in X$  that is an eigenvector of every  $A_i$ .
  - (c) Suppose that A and B are both diagonalizable. Prove that AB = BA if and only if they are *simultaneously diagonalizable*, i.e., there exists an invertible  $n \times n$ -matrix P such that both  $P^{-1}AP$  and  $P^{-1}BP$  are diagonal matrices.

5.	Consider the matrices $A =$	0	2	0	and $B =$	-3	5	0.
				3				

- (a) Decompose  $\mathbb{R}^3$  into a direct sum of eigenspaces of each matrix.
- (b) Further decompose the 2-dimensional A-eigenspace as a direct sum of two 1-dimensional B-eigenspaces, and vice-versa.
- (c) Write  $\mathbb{R}^3$  as a direct sum of three 1-dimensional subspaces that are common eigenspaces of A and B, two different ways.
- (d) For each of your answers to Part (c), find a matrix P so that  $P^{-1}AP = D_A$  and  $P^{-1}AP = D_B$ , where  $D_A$  and  $D_B$  are diagonal.
